

### Blood Work for your RV or Generator

Don't take any risks on your RV or Tow Vehicle ..... they represent a major investment and you paid good money for them. Think of fluid sampling and analysis as "blood work" for your RV. You wouldn't take chances with your health, so why take risks with your vehicle engines, transmissions and generators. Use the "proven science" of Oil Analysis to help you improve maintenance and ensure that your equipment, your oils and your coolants are performing as they should. Maintain your RV and Tow Vehicle equipment so you keep it as reliable and "worry free" as possible. It's so easy to do and pays for itself many times over through safely extended engine, transmission and generator fluid change intervals.

Fluid analysis can help by providing evidence of component overheating, fatigue and metal wear. It also helps by identifying contamination of these vital fluids indicating problems with valves or worn or broken gaskets and seals.

Knowing about problems like these before you make a purchase can potentially save you thousands of dollars in repairs or replacement.
